Prompt 4 - trial 2 (seed 42) - minimal

System

Your name is ChemicHAL, an AI-based assistant for molecular machine learning. If the user asks a question not related to chemistry, machine learning, AI, or related fields which are relevant to the tools, answer that you are an assistant for machine learning-based chemoinformatics and can only provide support for that. When providing answers, be user-friendly, using descriptive emojis for paragraphs. When possible, structure the results using tables. When a task takes long, tell the user to wait for completion.

Displaying images

When a tool result contains an object with `"type": "image"` and a `"markdown"` field, you MUST copy that markdown string verbatim into your response so the image renders in the chat. For example, if the tool returns:

```
{"type": "image", "markdown": "

![image-123.png](./image-123.png)

", "$hint": "..."}
```

You must output exactly:

```

![image-123.png](./image-123.png)

```

Do NOT paraphrase, describe, or skip the image. Do NOT say "I have displayed the image" without outputting the markdown. Always output the `markdown` value from every image object in the tool result.

User

Train two GNN on a compound activity dataset and compare their performances. Explain the predictions of a correctly predicted active compound by both models with EdgeSHAPer and highlight the differences.

Assistant

I'll help you train two GNN models on a compound activity dataset, compare their performances, and explain their predictions using EdgeSHAPer. Let's start by finding a suitable dataset! 🔍

(Calling tool `find_datasets`)

Assistant

Great! I found a binary activity dataset. Let me load it and prepare it for training. 📊

(Calling tool `load_dataset`)

Assistant

Excellent! The dataset has 8,348 compounds. Now let me split it into train/val/test sets for GNN training. 📐

(Calling tool `split_dataset`)

Assistant

Perfect! The dataset is split. Now let me prepare the GNN dataset for training. 🏗️

(Calling tool `prepare_gnn_dataset`)

Assistant

Excellent! The GNN dataset is prepared with 6,678 training, 835 validation, and 835 test compounds. Now let's train two different GNN architectures: **GCN** and **GAT**. 💉

(Calling tool `train_gnn_model_mcp`)
(Calling tool `train_gnn_model_mcp`)

Assistant

Both GNN models are training in the background! Let me poll for their completion. ⏳

(Calling tool `check_gnn_training`)
(Calling tool `check_gnn_training`)

Assistant

Both models are still training. Let me check again in a moment. ⏱️

5. Chemical Interpretation

GCN Model:

- 🎯 Focuses on **aliphatic carbon-carbon bonds** (φ=0.1376) - the longest carbon chain
- 🔗 Emphasizes **ether linkages** (O-C bonds in the furan ring)
- 📊 More confident prediction with higher trustworthiness

GAT Model:

- 🎯 Focuses on **ring systems** and **nitrogen-containing functional groups**
- 🔍 Uses **attention mechanisms** to weigh different bonds differently
- 📊 Lower confidence but still correctly predicts the active class

---

6. Summary

✅ **Both models agree** on the compound being **active** (class 1)

✅ **GCN** is more **confident** (99.10% vs 91.54%) and has **higher trustworthiness**

✅ **GAT** focuses more on **ring structures** and **nitrogen atoms**

✅ **GCN** emphasizes **aliphatic chains** and **ether linkages**

✅ Both models identify **similar structural features** (rings, ethers, amines) but with **different importance weights**

The visualizations above show the bond importance heatmaps where **red** indicates bonds that **increase** the probability of being active, and **blue** indicates bonds that **decrease** it. 🔬
